Source: IMF staff
1/ Public sector is defined as general government
2/ Based on available data
3/ Bond Spread over U.S. Bonds.
4/ Defined as interest payments divided by debt stock at the end of previous year
5/ Derived as [(r - p(1+g) - g + ae(1+r))/(1+g+p+gp)] times previous period debt ratio, with r = interest rate; p = growth rate of GDP deflator; g = real GDP growth rate; a = share of foreign-currency denominated debt; and e = nominal exchange rate depreciation
6/ The real interest rate contribution is derived from the denominator in footnote 4 as r - π (1+g) and the real growth contribution as -g
7/ The exchange rate contribution is derived from the numerator in footnote 2/ as ae(1+r).
8/ Includes changes in the stock of guarantees, asset changes, and interest revenues (if any). For projections, includes exchange rate changes during the projection period.
9/ Assumes that key variables (real GDP growth, real interest rate, and other identified debt-creating flows) remain at the level of the last projection year
